To view and print the following techniques, refer to the PDF file of this Quick Reference Guide. #0-1 Notes: Fire Pump Installation This edition of the Quick Reference Guide provides information and advice for using the software to design and draft a plan view of a fire pump installation. Doing so, you can decide if a fire pump installation is suitable for your project, and how to optimize the design of the installation. For more information about fire pump installation, see the Fire Pump Installation chapter of the 2016 Autodesk Professional Field Application Guide for AutoCAD: A Complete Guide to Creating, Engineering, and Deploying AutoCAD Solutions, which is available at the following link: [Table of Contents Important AutoCAD commands and settings Procedure 0-1 Notes: Fire Pump Installation Fire Pump Installation Procedure 0-1 Notes: Fire Pump Installation 0-2 Fire Pump Installation 0-2-1 Plan view 0-2-2 Elevation view 0-2-3 Front elevation 0-2-4 Rear elevation 0-3 Fire pump system requirements 0-3-1 Fire pump system requirements 0-3-2 Fire pump system requirements 0-3-3 Fire pump system requirements 0-3-4 Fire pump system requirements 0-3-5 Fire pump system requirements 0-3-6 Fire pump system requirements 0-3-7 Fire pump system requirements 0-3-8 Fire pump system requirements 0-3-9 Fire pump system requirements 0-3-10 Fire pump system requirements 0-3-11 Fire](#)

Beyond these general purpose tools, there are also a number of tools which have been specifically written to work with the 3D objects in AutoCAD. Batch file The AutoCAD command line allows for the definition of custom command scripts. A command script is a batch file which is typically used for batch operations such as for example, drawing a large number of files from a folder or unzipping a folder of AutoCAD files into a different directory. A command script has a specific format (see Batch file) and the AutoCAD command line provides for writing them in a text editor such as Notepad++. The command line is, in general, a powerful interface for defining scripts and has been given a number of tools to help people with the development of their own command scripts. Examples include the ability to edit Bézier curves, edit text information, modify drawing style and so on. AutoCAD's command line has been designed so that it is simple to extend and is extensible. It is based on the CMD.EXE (Windows command prompt) scripting system, and so is designed to be compatible with existing Microsoft command scripts. Windows scripting environment The Windows scripting environment is included in every AutoCAD installation, and is used for writing scripts for the command line or for scripting the Windows GUI. Windows scripting files are XML documents with a specific format and structure. Windows scripting files use namespaces (the first line of the script will usually be something like a1d647c40b

## What's New in the AutoCAD?

**Polar Mapping** : Improve accuracy and efficiency with intuitive polar grids. Use polar coordinates to indicate degrees of azimuth and elevation, and add a novel grid design feature that allows you to easily create and use polar grids regardless of which axis you select. (video: 1:28 min.) **Colored Line Display** : View and edit your drawing as if it were on paper with colored line display. Use various colors to highlight your drawing elements so you can see which lines connect to each other, such as branches, floor or wall surfaces, and critical structures.
